It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Center project name: 15519

                                                                                                                                                                                              A cDNA clone (AAT66243) codes for Arabidopsis violaxanthin de-epoxidase (VDE) (AAW09976), an enzyme that catalyses the de-epoxidation of violaxanthin to zeaxanthin and antheraxanthin. VDE nucleic acids (see also AAT66241-42), in sense or antisense plastid translocation sequence, to modify VDE levels in plants. Increased levels result in the plant being tolerant of increased levels result in the plant being tolerant of increased light and therefore more productive and/or more resistant to disease. Underexpression of VDE increases photosynthetic efficiency under low light. The photosensitivity of a range of crops, trees and ornamentals can be modified.
                                                                                                              modify the

VDE nucleic acids (see also AAT66241, AAT66243), in sense or antisense orientation, can be used in genetic constructs, pref. also contg. a plastid translocation sequence, to modify VDE levels in plants. Increased levels result in the plant being tolerant of increased light and therefore more productive and/or more resistant to disease. Indexexpression of VDE increases photosynthetic efficiency under low light. The photosensitivity of a range of crops, trees and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         543

```
A cDNA clone (AAT66241) codes for the 55 kDa violaxanthin de-epoxidase (VDE) (AAM09874) of romaine lettuce. VDE was purified from romaine lettuce chloroplasts and 2 tryptic peptides were used to develop primers (see also AAT6624445), which amplified a partial VDE sequence. The amplified sequence was then used to screen a lettuce CDNA library, and the 1981 bp DNA sequence was identified. VDE nucleic acids (see also AAT6624-43), in sense or antisense orientation, can be used in genetic constructs, pref. also contg. a plastid translocation sequence, to modify VDE levels in plants. Increased levels result in the plant being tolerant of increased light and therefore more productive and/or more resistant to disease. Underexpression of VDE increases photosynthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             encoding plant violaxanthin de-epoxidase - used to modify the

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            1382 tgaggttgaaaaattgtttgggaaagctttgccaatcaggaaggtcaggtagaaacaaga 1441

```
Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  962 tatatttgtatactaccgtgggggaaacgatgcttgggatggtggtggtggtgcagttgt 1021

The invention is used for electronic detection of nucleic eacids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1022 atacacgagaagttctgtattacccaatagcattataccagaactcgaaaaagcagcaaa 1081

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1022 atacacgagaagttetgtattacecaatageattataceagaaetegaaaaageageaaa 1081
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                       The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Electron-transfer group; ETM; mismatch; genotyping;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids containing electron-transfer hybridization assays, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 6; Page 127; 159pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (CLIN-) CLINICAL MICRO SENSORS INC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ggigacaacaagciigtiggaaacaictciiggagaataaagaccciagacagiggaiic 821

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                               The present invention relates to a composition comprising two nucleic
                                                                                                                                                          acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                     The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DB 22; Length 938;
                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 938 BP; 4 A; 144 C; 9 G; 5 T; 776 other;
